# **Association Rule Mining**

 Given a set of transactions, find rules that will predict the occurrence of an item based on the occurrences of other items in the transaction

#### **Market-Basket transactions**

TID	Items
1	Bread, Milk
2	Bread, Diaper, Beer, Eggs
3	Milk, Diaper, Beer, Coke
4	Bread, Milk, Diaper, Beer
5	Bread, Milk, Diaper, Coke

#### **Example of Association Rules**

$$\begin{split} & \{ \text{Diaper} \} \rightarrow \{ \text{Beer} \}, \\ & \{ \text{Milk, Bread} \} \rightarrow \{ \text{Eggs,Coke} \}, \\ & \{ \text{Beer, Bread} \} \rightarrow \{ \text{Milk} \}, \end{split}$$

Implication means co-occurrence, not causality!

# **Definition: Frequent Itemset**

#### Itemset

- A collection of one or more items
  - Example: {Milk, Bread, Diaper}
- k-itemset
  - · An itemset that contains k items

#### Support count (σ)

- Frequency of occurrence of an itemset
- E.g. σ({Milk, Bread,Diaper}) = 2

#### Support

- Fraction of transactions that contain an itemset
- E.g. s({Milk, Bread, Diaper}) = 2/5

#### Frequent Itemset

 An itemset whose support is greater than or equal to a minsup threshold

Tan,Steinbach, Kumar Introduction to Data Minin

D	Items
	Bread, Milk
	Bread, Diaper, Beer, Eggs
	Milk, Diaper, Beer, Coke
	Bread, Milk, Diaper, Beer
	Bread, Milk, Diaper, Coke

#### **Definition: Association Rule**

#### Association Rule

- An implication expression of the form X → Y, where X and Y are itemsets
- Example: {Milk, Diaper} → {Beer}

#### Rule Evaluation Metrics

- Support (s)
  - Fraction of transactions that contain both X and Y
- Confidence (c)
  - Measures how often items in Y appear in transactions that contain X

# 1 Bread, Milk 2 Bread, Diaper, Beer, Eggs 3 Milk, Diaper, Beer, Coke 4 Bread, Milk, Diaper, Beer 5 Bread, Milk, Diaper, Coke

### Example:

 $\{Milk, Diaper\} \Rightarrow Beer$ 

 $s = \frac{\sigma(\text{Milk}, \text{Diaper}, \text{Beer})}{|T|} = \frac{2}{5} = 0.4$ 

 $c = \frac{\sigma(\text{Milk}, \text{Diaper}, \text{Beer})}{\sigma(\text{Milk}, \text{Diaper})} = \frac{2}{3} = 0.67$

# **Association Rule Mining Task**

- Given a set of transactions T, the goal of association rule mining is to find all rules having
  - support ≥ minsup threshold
  - confidence ≥ minconf threshold
- Brute-force approach:
  - List all possible association rules
  - Compute the support and confidence for each rule
  - Prune rules that fail the minsup and minconf thresholds
  - ⇒ Computationally prohibitive!

# **Mining Association Rules**

# TID Items 1 Bread, Milk 2 Bread, Diaper, Beer, Eggs 3 Milk, Diaper, Beer, Coke 4 Bread, Milk, Diaper, Beer 5 Bread, Milk, Diaper, Coke

## Example of Rules:

 $\begin{array}{ll} \{\mbox{Milk, Diaper}\} \rightarrow \{\mbox{Beer}\} \ (s=0.4, c=0.67) \\ \{\mbox{Milk,Beer}\} \rightarrow \{\mbox{Diaper}\} \ (s=0.4, c=0.67) \\ \{\mbox{Diaper,Beer}\} \rightarrow \{\mbox{Milk}\} \ (s=0.4, c=0.67) \\ \{\mbox{Beer}\} \rightarrow \{\mbox{Milk, Diaper}\} \ (s=0.4, c=0.5) \\ \{\mbox{Milk}\} \rightarrow \{\mbox{Diaper,Beer}\} \ (s=0.4, c=0.5) \\ \{\mbox{Milk}\} \rightarrow \{\mbox{Diaper,Beer}\} \ (s=0.4, c=0.5) \\ \end{array}$ 

#### Observations:

- All the above rules are binary partitions of the same itemset: {Milk, Diaper, Beer}
- Rules originating from the same itemset have identical support but can have different confidence
- Thus, we may decouple the support and confidence requirements

© Tan,Steinbach, Kumar Introduction to Data Mining 4/18/2004 5

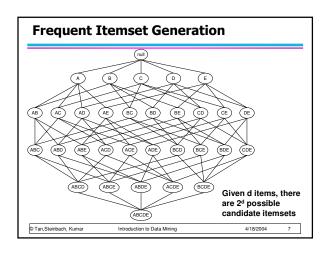

# **Mining Association Rules**

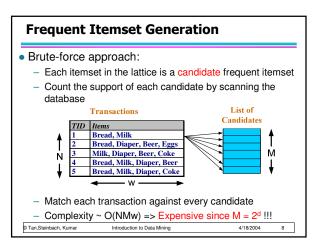

- Two-step approach:
  - 1. Frequent Itemset Generation
    - Generate all itemsets whose support ≥ minsup

#### 2. Rule Generation

- Generate high confidence rules from each frequent itemset, where each rule is a binary partitioning of a frequent itemset
- Frequent itemset generation is still computationally expensive

© Tan,Steinbach, Kumar Introduction to Data Mining 4/18/2004 6

# **Frequent Itemset Generation Strategies**

- Reduce the number of candidates (M)
  - Complete search: M=2d
  - Use pruning techniques to reduce M
- Reduce the number of transactions (N)
  - Reduce size of N as the size of itemset increases
  - Used by DHP and vertical-based mining algorithms
- Reduce the number of comparisons (NM)
  - Use efficient data structures to store the candidates or transactions
  - No need to match every candidate against every transaction

Tan, Steinbach, Kumar Introduction to Data Mining 4/18/2004 9

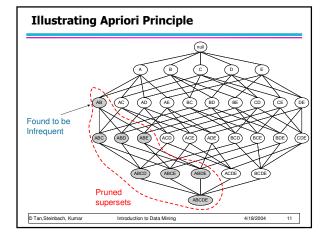

# **Reducing Number of Candidates**

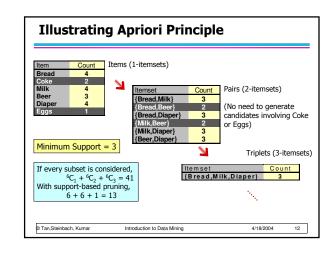

- Apriori principle:
  - If an itemset is frequent, then all of its subsets must also be frequent
- Apriori principle holds due to the following property of the support measure:

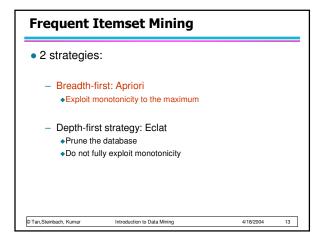

$$\forall X, Y : (X \subseteq Y) \Rightarrow s(X) \ge s(Y)$$

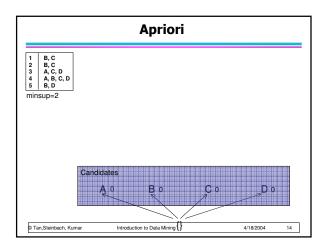

- Support of an itemset never exceeds the support of its subsets
- This is known as the anti-monotone property of support

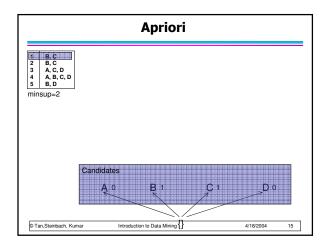

© Tan,Steinbach, Kumar Introduction to Data Mining 4/18/2004 10

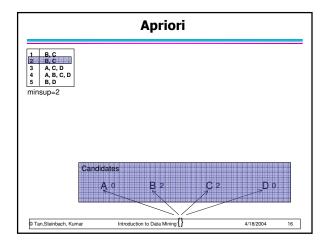

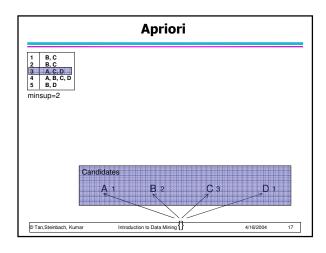

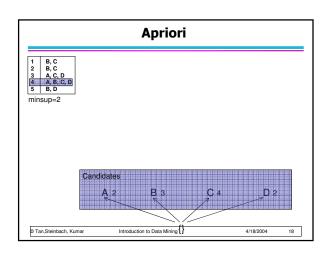

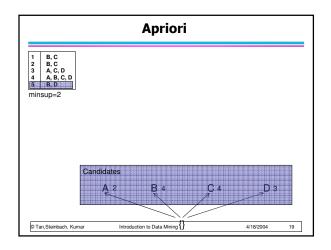

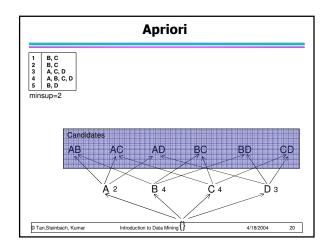

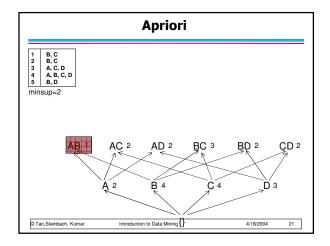

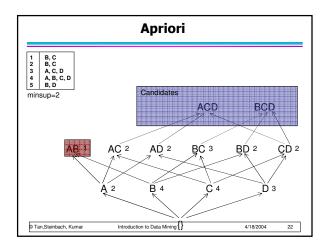

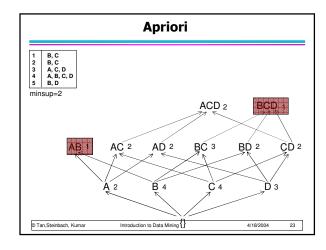

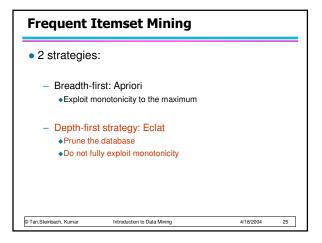

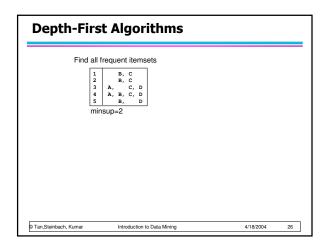

# Method: Let k=1 Generate frequent itemsets of length 1 Repeat until no new frequent itemsets are identified Generate length (k+1) candidate itemsets from length k frequent itemsets Prune candidate itemsets containing subsets of length k that are infrequent Count the support of each candidate by scanning the DB Eliminate candidates that are infrequent, leaving only those that are frequent

# **ECLAT**

Determine support of any k-itemset by intersecting tid-lists of two of its (k-1) subsets.

- Depth-first traversal of the search lattice
- Advantage: very fast support counting
- Disadvantage: intermediate tid-lists may become too large for memory

#### **Rule Generation**

- Given a frequent itemset L, find all non-empty subsets f ⊂ L such that f → L − f satisfies the minimum confidence requirement
  - If {A,B,C,D} is a frequent itemset, candidate rules:

• If |L| = k, then there are  $2^k - 2$  candidate association rules (ignoring  $L \to \emptyset$  and  $\emptyset \to L$ )

Tan, Steinbach, Kumar Introduction to Data Mining

4/18/2004

#### **Rule Generation**

- How to efficiently generate rules from frequent itemsets?
  - In general, confidence does not have an antimonotone property

 $c(ABC \rightarrow D)$  can be larger or smaller than  $c(AB \rightarrow D)$ 

- But confidence of rules generated from the same itemset has an anti-monotone property
- e.g., L = {A,B,C,D}:

$$c(ABC \to D) \geq c(AB \to CD) \geq c(A \to BCD)$$

 Confidence is anti-monotone w.r.t. number of items on the RHS of the rule
